Hi **G1**! 😊

We are opening a national lottery and we choose you to create an application for our online customers.

Here are the requirements:

➢ For start we will have only 2 sessions.

➢ Both sessions will store the user's tickets, winning combination and method to start the session.

➢ The difference is that the first session will have extra method randomly to choose one of tickets without win and give the user TV award, and the second session will have the same method but it will choose random user with two matches/hits and give him/her Vacation award.

➢ One ticket will have combination of 7 numbers between 1 and 36.

➢ All 7 numbers from 1 to 36 in winning combination in session will be selected randomly.

➢ Users will be able to create a ticket with numbers of their choice.

➢ One ticket is with win if there are at least 4 matches with the winning combination.
➢
➢ Here are the prizes:
   o 4 matches = TV
   o 5 matches = Vacation
   o 6 matches = Motorbike
   o 7 matches = Car 😊

➢ After the session is completed, we will print on the screen all users that have at least 4 matches and their prizes.
